CdS

SOURCE: Elektrotechnicky casopis, no. 2, 1966, 137-142

TOPIC TAGS: electron bombardment, cadmium sulfide

ABSTRACT: The article reports on experimental work conducted to determine the maximum current gain induced by monochromatic bombardment of cadmium sulfide polycrystalline layers with electrons with a density of 10^{-8} - 10^{-11} A/sq cm. The authors thank Engineer Safar, of Tesla-Blatna for providing the Cadmium sulfide samples. Orig. art. has: 8 figures. [JPRS: 36,644]

TITLE: A pneumatic relay. Class 42, No. 182416

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 11, 1966,
103-104

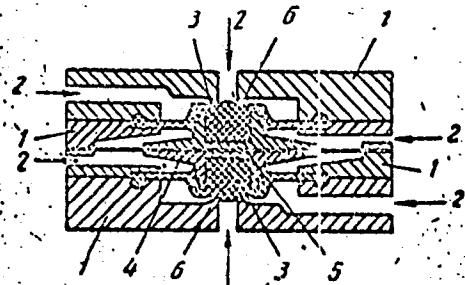

TOPIC TAGS: pneumatic device, nonelectric signal equipment

ABSTRACT: This Author's Certificate introduces a pneumatic relay which contains a housing made in the form of disc plates with channels, a diaphragm unit which forms a number of chambers, and nozzles mounted in the flow chambers. Short circuiting conditions are prevented by making the face plates on the rigid center of the diaphragm unit from an elastic material, e. g. rubber, and putting a greater distance between the planes of these face plates than between the edges of the nozzles.

TITLE:

The Homologs of Monovinyl Acetylene (Gomologi monovinilatsetileni)VII. The Dehydration of Secondary Acetylene Alcohols (VII). Degidratatsiya vtorichnykh atsetilenovykh spirtov)

PERIODICAL:

Zhurnal obshchey khimii, 1958, Vol 28, Nr 7,
pp. 1785 - 1791 (USSR)

ABSTRACT:

Vinyl acetylene hydrocarbons with alkyl radicals at the terminal carbon atoms of the combined system may be obtained by the dehydration of secondary acetylene alcohols. These compounds were of interest to the authors with respect to their styrene dimerization (Ref 1). In the present paper the dehydration of four secondary acetylene alcohols was investigated: iso-propyl-acetylene carbinol (Formula I), n-propyl-acetylenyl carbinol (II), isopropyl-(methylacetylenyl)-carbinol (III) and ethyl-(methylacetylenyl)-carbinol (IV) (see the four formulae given). These compounds were synthesized according to A.Ye. Favorskiy (60-65%). Many dehydration experiments of the compounds (I) and (II) were carried out, they were, however, not success-

Card 1/3

Dehydration of Secondary Acetylene Alcohols

sov/79-28-7-15/64

ful. The desired hydrocarbons with substituents at both ends of the combined system were obtained only by the dehydration from the compounds (III) and (IV); they were: 2-methyl-hexene-2-in-4(V) and hexene-2-in-4 (VI) which correspond to the empiric formulae C_7H_{10} and C_6H_8 . The secondary α,β -acetylene alcohols with an acetylene terminal group do not separate water under their usual dehydration conditions. As seen by spectroscopic examinations the hydration of hexene-2-in-4 leads to the unsaturated α,β -ketone, the hexene-4-on-3. There are 1 figure, 1 table, and 14 references, 5 of which are Soviet.

TITLE: Methods for the Determination of Alkoxy Groups

PERIODICAL: Vestnik Leningradskogo universiteta. Seriya fiziki i khimii, 1959, Nr 3, pp 119 - 127 (USSR)

ABSTRACT: Alkoxy groups are quantitatively determined by the reaction of organic substances with boiling hydriodic acid under the separation of the alkyl radical bound to oxygen and formation of alkyl iodide. The method employed here is discussed and the reaction apparatus of Steyermark (Ref 4) and Viebock³ (Ref 5) are depicted. The errors of measurements of Viebock's device were due to the volatility of the low alcohols. They are insoluble in hydriodic acid; thus, an increase in the concentration of hydriodic acid is insufficient. Therefore, a method for the washing out of the rests of hydriodic acid and iodine was developed. Sodium thiosulfate was used for this purpose which had, however, a disturbing effect due to the interaction between methyl iodide and thiosulfate. Better results were obtained after an addition of sodium acetate (Table 2). The authors of the present paper developed a universal method

Card 1/2

Methods for the Determination of Alkoxy Groups

SOV/54-59-3-18/21

on the basis of Hoffman's apparatus (Ref 10) which may be used for determinations of alkoxy groups up to a content of 60%, and which yields good results. Table 3 gives the data. It was also possible to determine glycerin by the mentioned method. Figure 3 shows the scheme of the apparatus and a description thereof is given. Hydriodic acid, red phosphorus, crystalline iodine, 10% sodium acetate solution in glacial acetic acid, 25% ~~potassium acetate, bromine~~, 80-90% formic acid, potassium iodide and 0.1 n thiosulfate solution were used as reagents. The production of concentrated hydriodic acid is described. The determination was carried out in two stages: at first the substances were separated with hydriodic acid and the alkyl iodides were distilled. Table 4 gives the experimental condition for the carrying out of the determination. The distillate is mixed with sodium acetate, filled with distilled water, and some drops of formic acid are added. After decoloring and addition of sodium iodide titration is carried out with thiosulfate; 1 ml 0.1 n thiosulfate corresponds to 0.517 ml CH_3COCH_3 and 0.751 ml OC_2H_5 . There are 3 figures, 4 tables, and 11 references, 1 of which is Soviet.

Karp, Ed.; N.M. Ayzenshtat, Doctor of Technical Sciences, Professor; Ed. of Publishing House, Akad. Nauk; Tech. Ed.: S.G. Tikhonov.

PURPOSE: This collection of articles is intended for scientific workers, industrial designers and engineers interested in automation and telemechanics.

CONTENTS: The collection of 23 articles is a continuation of an earlier work of the Academy of Sciences USSR, on pneumatic and hydraulic automation systems, published in 1970. A wide range of problems concerning with the design and operation of pneumatic and hydraulic automation equipment is described. An addition to problems based on experiments, the collection also contains discussions of new trends in the field, such as the possibility of using micro-computers in automation of pneumatic devices. Some articles of this collection were written in the German language. Appendix and references to recent literature approach the subject at the articles.

TITLE: Dynamic properties of automatic pilots and recommendations as to their setting

PERIODICAL: Referativnyy zhurnal. Avtomatika i radioelektronika, no. 8, 1961, 38, abstract 8 V295 (V sb. Vopr. pnevmo- i gidroavtomatiki, M., AN SSSR, 1960, 68-78)

TEXT: The results are given of experimental analysis of dynamic properties of pneumatic regulators. The experiments were carried out with ПИ - (PI) and ПИД - (PID) regulators, designed from the standard elements of an automatic pilot. For each regulator a structural diagram is presented and the standard equation derived which determines the law of the regulation input and the dependence of coefficients of this equation on the parameters of regulator setting. The frequencies are determined, at which the regulator reproduces, with adequate accuracy, the law of the regulation input.

FORWORD: This book is intended for specialists in the field of machine and instrument manufacture who use radioactive isotopes in the study of materials and processes.

CONTENTS: This collection of papers covers a very wide field of the utilization of tracer methods in industrial research and control techniques. The topic of this volume is the use of radioisotopes in the machine and instrument manufacturing industry. The individual papers discuss the applications of radioactive techniques in the study of metal and alloys, problems of friction and lubrication, metal cutting, engine performance, and defects in metallization of industrial processes, recording and measuring devices, quality control, flowmeter, level, pressure, safety devices, radiation counters, etc. These papers represent contributions of various Soviet institutes and laboratories. They were published at the transaction of the All-Union Conference on the Use of Radioactive Isotopes and Radioactive Materials in the Metallurgical and State Enterprises and Institutes in the National Economy and Science April 1-12, 1977. No personal names are mentioned. References are given at the end of each paper.

Title : Resistance to rust in wheat and oats produced by ionizing radiation.

Orig Pub: V. sb.: Primenenie radioaktivnykh izotopov v promstsi,
meditsine i s. kh., M., AN SSSR, 1956, 525-532

Abstract: In order to breed types of oats and wheat resistant to stem-rust caused by Puccinia graminis tritici Eriks. Henn. and Puccinia graminis avenae Eriks. Henn., and also the kind of oats resistant to coronal rust caused by Puccinia coronata Eriks, the seeds of the originally non-resistant varieties were subjected to irradiation. Irradiated were: a variety of summer wheat Li, resistant to all rust strains except strain 15B; a variety of Ayaks oats sensitive to strain 8 of stalk rust; and a variety of Klintaf oats sensitive to

strain 7 of stalk rust and to many widely distributed strains of coronal rust. Doses of roentgen rays 12,000-16,000 r and thermal neutrons $9.44 \cdot 10^{12} / \text{cm}^2$ were used. The plants obtained from the treated seeds (generations X and N) were germinated alongside of a control on a provocative (?) background. In the Li variety in generations X_2 and N_2 resistant specimens were picked. All the control plants were non-resistant. In most cases generations N_3 and N_4 obtained from resistant plants of generation N_2 proved resistant, which indicates their homozygosis with respect to resistance. The generations X_3 and X_4 proved moderately resistant. In the Ayaks and Klintaf varieties among families of generation N_2 resistant specimens were also picked; in addition, several mutants were found in the oat varieties with a chlorophyll deficiency. Whether the responsibility for resistance of the treated material depends on the same loci which determine the resistance of several existing varieties or other loci, is unknown so far. Even if the resistance is de-

etermined by the same loci, the breeding of mutants resistant to definite rust strains while they retain other attributes of the variety, is extremely valuable. The improvement of varieties is accomplished in this fashion more rapidly than with the ordinary methods of selectivity, and with a smaller risk of losing any of the desired properties of the improved variety.

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 9, 1965, 79			
TOPIC TAGS: instrument calibration, <u>meteorological instrument</u> , radiosonde, photo cell, manometer			
ABSTRACT: This Author's Certificate introduces: 1. A device for calibrating pressure transducers in hydrometeorological instruments, e.g. radiosondes. The unit contains an automatic recorder, a pneumatic system, photocells which are connected to a control unit, and a mercury manometer. The measurement arm of the manometer is connected to a pressure chamber which contains the radiosondes to be calibrated. The instrument is designed for improved efficiency and accuracy of calibration. Stationary screens are mounted along the measurement arm of the cistern-siphon manometer. These screens have diaphragms at levels which correspond to the measurement

program. The device also contains a movable rack which is connected with a step mechanism and has a single aperture opposite each photo relay. 2. A modification of this device which has a photo relay mounted at the reading level and connected through a control unit to the feed for the manometer tank. In this way the level of the mercury in the neutral arm of the manometer can be automatically maintained at a constant level and errors caused by changes in atmospheric pressure and mercury evaporation can be eliminated.

Orig Pub : Il-a Consf. tehn.-stiint. a Ind. usoare. Textilo.
(Bucuresti), ASIT, 1957, 302-306

Abstract : Results of investigations conducted by the Textile Research Institute indicate the feasibility of utilizing various processes now employed in the finishing of cotton textiles (bleaching, mercerizing, dying and other finishing steps) in the finishing of linen textiles. In the production of fine linen materials it is recommended to conduct mercerization at lower tension, thus

permitting the use of linen fibers as the base. For large-scale manufacture of linen fabrics it is necessary to have a special finishing plant section equipped with apparatus in which raw fiber and fabrics would be subjected to the hypochlorite-peroxide bleaching, mercerization, and processes that would improve crease resistant properties of fabrics. -- G. Markus

TITLE: The formulation of new trends of research on the structure of
the Earth's crust and upper mantle in Turkmenistan by geophysical
methods ✓✓

SOURCE: Ref. zh. Geofizika, Abs. 2G6

REF SOURCE: Sb. Geol. rezul'taty prikl. geofiz. Geofiz. issled.
stroyeniya zemn. kory. M., Nedra, 1965, 33-44

TOPIC TAGS: Earth crust, upper mantle, electromagnetic field,
magnetotelluric probing, seismologic testing

ABSTRACT: Information on the structure of the Earth can be obtained
by a magnetotelluric probing method of observation and interpretation
of the recordings of various types of elastic waves, generated during
natural earthquakes, and by studying the variations with different
periods of the natural electromagnetic field of the Earth. This
method is based on the study of the ratio of variations in the elec-
tric and magnetic components of the Earth's electromagnetic field.

L 47108-66

ACC NR: AR6019884

Magnetotelluric probing stations provide the possibility of studying variations of the electromagnetic field during a period of 10 seconds to 24 hours. For improved seismological testing, it was very important to design equipment with an intermediate magnetic recording. An increased resolution of the recordings of the seismograph made it possible to use new inputs to determine the type and analysis of composite waves. Seismological observations and subsurface magnetotelluric probing in Turkmenistan proved the possibility of using both methods for studying sedimentary layers as well as the structure of the Earth's crust and the upper mantle down to depths of approximately 200--250 km. AUTHOR: Avakh, Yu.A., Engineer

TITLE: Checking the cores of magnetic amplifiers with self-excitation and small control circuit resistance according to their quasi-operating characteristics

SOURCE: Moscow. Vyssheye tekhnicheskoye uchilishche. [Trudy], no. 105, 1961. Vysokoproizvoditel'nyye protsessy i avtomaticheskaya osnastka v priborostroyenii, 151 - 168

TEXT: The author describes a method of checking the cores of magnetic amplifiers by simulating the control current through a special arrangement, reproducing the operating conditions of the amplifier (quasi-operating load characteristics). It is shown that the length of the operating part of the amplifier load characteristic is independent of their relative position in the $I_{load}/I_{load\ max}$ - $H_{control}$ plane, so that a magnetic amplifier with a given characteristic may be designed using cores, the quasi-load characteristics with a considerable spread of their slopes ($\tan \varphi$) and

X

Card 1/3

Checking the cores of magnetic ...

S/549/61/000/105/002/002
D201/D302

$H_{control}$. The method of checking may, therefore, be reduced to grouping the cores in m groups according to their tan φ spread, k groups according to their cut-off $H_{control}$ and dividing the total $\Delta H_{control}$ for a given set of cores into n sections with plus or minus signs with respect to the nominal $H_{control}$ value. Then the control characteristics of magnetic amplifiers, using cores having paired indices n , m and k , but of different signs, will be contained within the given tolerance spread. It is also shown that in designing magnetic amplifiers, their parameters should be chosen in such a manner that the nominal values of basic characteristic parameters coincide in the best possible way with the mid-points of the spread area of the corresponding parameters of core characteristic. If so, the number of rejected cores will be minimized. The method described, together with the load characteristics simulator, makes it possible to measure the quasi-operating load characteristics of rectangular hysteresis loop cores, together with the corresponding control characteristics of self-excited magnetic amplifiers with a small value of resistance in the control circuit. The Card 2/3

Checking the cores of magnetic ...

S/549/61/000/105/002/002
D201/D302

checking of cores from their quasi-operating characteristics makes it possible to determine analytically the permissible spread of the core parameters, as depending on the requirements imposed on the magnetic amplifier itself.

"The Action of 4-Methyluracyl (I) and of 4-Methyl-2-Thiouracyl (II) on the Process of Oxidation of Ascorbic Acid (III)," V. G. Mkhitarian, E. A. Avakimova, S. G. Shchukuryan, Sci-Res Inst of Roentgenol and Oncol, Min of Health, Armenian SSR (Yerevan)

Vop Pit, Vol 12, No 4, pp 24-28

It has been established that both thiamine and purine derivs inhibit the oxidation of III. I and II also have this effect. The antioxidant action of II is stronger than that of I, and is exhibited both in the presence and absence of Fe or Cu ions. 269T38

A V A R I M O V A, E. H.

Y

Action of some derivatives of pyrocatechol. V. G. Mkhitaryan, S. G. Shukuryan, Dzhelaly Ahsad, Nana Armyan, S. A. Kostyan, S. G. Oshapyan, L. A. Arakimova (1983) (in Russian). —Methyl-3-thiouracil (I) in phosphate buffer at pH 7.23 strongly inhibits the oxidation of pyrocatechol (II) either in the presence or the absence of Cu⁺⁺ or Fe⁺⁺⁺ ions. In phosphate buffer at pH 6.4, I strongly inhibits the oxidation of II, but it does not inhibit the oxidation in the presence of Fe⁺⁺⁺ ion. 4-Methyl-

uracil (III) in phosphate buffer at pH 7.23 weakly inhibits the oxidation of II, but it shows little influence on the oxidation in the presence of Fe⁺⁺⁺ and Cu⁺⁺ ions. In a phosphate buffer at pH 6.47 III does not inhibit the oxidation of II alone or in the presence of Fe⁺⁺⁺ ion, but it does inhibit it in the presence of Cu⁺⁺ ion. The tests were carried out with II which had been twice-recrystd. from phosphate buffer at pH 7.2 and pH 6.4. The oxidation of II is measured manometrically by the quantity of O consumed in a Warburg appn. at 37°. In the Warburg respirometer were used 3.3-ml. samples (7 mg. II in 1 ml. water, 0.05 mg. I in 3.1 ml. of water, and 0.2 ml. 80% KOH). In the tests with Cu and Fe ions (used as their sulfates), 3.1-ml. samples contg. 0.3 mg. Fe (0.001 ml.) or 0.001 mg. Cu (0.00 ml.) were employed.
